17. Launch Plan and Roadmap
18. Appendices

1. Executive Summary

This Product Design Requirements document defines the strategy, architecture, visual design system, SEO structure, pricing presentation, tracking requirements, and production standards for the ApexSites.ai public website and frontpage.

The primary objective is to build a premium SaaS marketing website that convincingly positions ApexSites as an AI-powered website platform for agencies, freelancers, solopreneurs, and entrepreneurs who want to generate, sell, host, and manage client websites faster than traditional web design production.

Core positioning statement

ApexSites helps agencies and entrepreneurs build, sell, host, and manage premium AI-generated websites under their own brand.

The website must not feel like a generic AI landing page or a basic dashboard login screen. It must feel like a serious, polished, high-converting SaaS website from an expensive digital product and brand design firm. The visual design standard should be premium, fast, clean, confident, technical, and agency-focused.

PDR Summary

Area	Requirement
Primary domain	apexsites.ai must function as the public marketing, SEO, conversion, and credibility site.
App/login	The application and login experience should live separately, ideally at app.apexsites.ai.
Primary audience	Agency owners, freelancers, solopreneurs, entrepreneurs, large agencies, and future reseller/enterprise partners.
Main conversion action	Start Free / Generate first website / View demo.
Pricing direction	Starter \$49, Agency \$99, Mid-Sized Agency \$299, Enterprise custom. Seats are sold as paid add-ons.
Usage model	Advertise included standard sites and AI credits. Do not expose Claude tokens publicly.
SEO goal	Build topical authority for AI website builders, white-label website builders, agency website software, and AI-generated client website fulfillment.
AI search goal	Make ApexSites easy for ChatGPT, Claude, Gemini, Grok, Perplexity-style tools, and other AI answer engines to understand and recommend.

2. Strategic Objective and Success Definition

The website must perform as the primary sales asset for ApexSites. Its job is not merely to explain software. Its job is to make agencies believe they can create a profitable, repeatable website business using ApexSites as the fulfillment engine.

Primary business goals

- Convert qualified visitors into free account registrations and paid subscriptions.
- Educate agencies on the business model: sell premium websites, fulfill faster, and add monthly hosting revenue.
- Rank for high-intent SEO keywords related to AI website generation, agency website platforms, white-label website builders, and website reseller software.
- Create credibility for a new brand through product proof, examples, social proof, and transparent pricing.
- Support paid acquisition through Meta, TikTok, Google, and LinkedIn tracking and retargeting infrastructure.
- Create crawlable, structured information that search engines and AI models can understand.

Primary user journey

1. Visitor lands on apexsites.ai from search, ad, referral, social, or AI recommendation.
2. Visitor understands within five seconds that ApexSites creates client-ready AI websites for agencies and entrepreneurs.
3. Visitor sees product proof through a live-style generation demo, examples, pricing, and business model explanation.
4. Visitor understands that ApexSites can generate websites, support white-label agency use, provide exports, and enable hosting add-ons.
5. Visitor starts free, watches a demo, or reviews pricing.
6. Visitor generates a first website or enters the app onboarding flow.
7. Visitor upgrades to a paid plan after seeing the value of website generation, client management, or white-label delivery.

Success metrics

Metric	Target / Direction
Homepage conversion rate	Measure Start Free, Watch Demo, Pricing Viewed, and Generate Site CTA clicks. Improve monthly.
Free account conversion	Track CompleteRegistration from public site to app.
Activation	Track GenerateSiteStarted and GenerateSiteCompleted. This is more important than raw registrations.
Paid conversion	Track StartTrial, InitiateCheckout, Subscribe, and plan selected.
SEO growth	Organic impressions, keyword rankings, organic signups, and indexed SEO pages.
AI search visibility	Brand mentions, referral traffic from AI tools, crawlability, llms.txt access, and answer-engine citations.
Core Web Vitals	Pass mobile and desktop thresholds. Performance is a product requirement, not an afterthought.

3. Brand Positioning

ApexSites should not be positioned as another drag-and-drop builder. The stronger market position is an agency operating system for AI-generated website fulfillment. The public website should consistently sell revenue, speed, control, and production quality.

Messaging hierarchy

Priority	Message
1	AI websites built in seconds. Sold under your brand.
2	ApexSites helps agencies generate premium, conversion-ready websites for clients without designers, developers, or weeks of production.
3	Build, sell, host, export, and manage client websites from one AI-powered platform.
4	Use ApexSites to increase margins, shorten fulfillment time, and create recurring hosting revenue.

Brand personality

Should feel like	Should not feel like
Premium, serious, modern, fast, technical, confident, agency-focused	Cheap, playful, generic, gimmicky, robotic, template-heavy, cluttered
A polished SaaS platform with strong product taste	A basic AI prompt wrapper or unfinished MVP
Built for business owners and agencies trying to make money	Built only for hobbyists experimenting with AI

Core language rules

- Lead with business outcomes, not model names or technical complexity.
- Do not advertise Claude token details to customers. Use sites, credits, projects, and plan limits.
- Use clear, direct copy. Avoid hype-heavy AI buzzwords unless tied to a concrete benefit.
- Use fictional example businesses until a real user has granted permission to appear publicly.
- Avoid claims like unlimited unless the system is truly unlimited and profitable at scale.

4. Target Customers and Personas

Persona	Pain	ApexSites promise	Primary CTA
Agency Owner	Too much client fulfillment depends on designers, developers, freelancers, and inconsistent timelines.	Generate and deliver client websites faster while maintaining margins and brand control.	Start Free / View Agency Plan
Freelancer / Solopreneur	Needs to sell websites without building every page manually or hiring help.	Launch a website service quickly and fulfill client work with AI-powered speed.	Start with Starter
Entrepreneur	Wants a fast way to build sites for new ventures, offers, and local business opportunities.	Turn ideas into polished websites and market-ready assets quickly.	Generate first site
Mid-Sized Agency	Needs repeatable production, more clients, and higher monthly volume.	Scale website production with credits, team workflows, white-label control, and priority generation.	Compare plans

Enterprise / Reseller	Needs custom volume, custom onboarding, API or reseller workflows, and negotiated usage.	Use ApexSites as a scalable AI website fulfillment layer.	Contact Sales
-----------------------	--	---	---------------

5. Information Architecture

The public site should separate marketing, SEO, pricing, examples, and community proof from the authenticated application. The homepage should not be the login page.

Public marketing site

Path	Purpose
/	Primary sales page and SEO authority page.
/features	Product capability explanation and feature SEO.
/examples	Fictional example websites and industry demonstrations.
/pricing	Pricing, package differences, site limits, credit explanations, and plan comparison.
/community	Social proof hub for TikTok, Facebook, Instagram, LinkedIn, reviews, and demos.
/resources	SEO content hub for blog, guides, agency growth, AI website design, and white-label web design.
/solutions/agencies	Agency-specific solution page.
/industries/roofers	Industry SEO page template example. Expand to other industries over time.
/compare/wix-studio	Competitor comparison template. Expand to Webflow, Framer, Duda, 10Web, WordPress, and others.

Application structure

App path	Purpose
app.apexsites.ai/login	Authentication.
app.apexsites.ai/signup	Account creation.
app.apexsites.ai/onboarding	Role, business type, and plan setup.
app.apexsites.ai/dashboard	Account overview and client/site management.
app.apexsites.ai/generate	Website generation workflow.
app.apexsites.ai/site-preview/[site-id]	Client preview and approval.
app.apexsites.ai/editor/[site-id]	Revision and editing environment.
app.apexsites.ai/hosting	Hosting setup and client site billing.
app.apexsites.ai/domains	Domain connection and domain sale/resale workflow.

app.apexsites.ai/white-label	Agency branding, logo, preview domain, and client-facing settings.
------------------------------	--

6. Homepage Experience Requirements

The homepage must sell the product, show the product, explain the agency business model, demonstrate credibility, and convert. The visitor should understand the offer before ever reaching pricing.

Homepage section sequence

Order	Section	Requirement
1	Navigation	Sticky, premium, minimal. Logo, Product/Features, Examples, Pricing, Community, Resources, Login, Start Free.
2	Hero	Clear product promise: AI websites built in seconds and sold under the agency brand. CTA: Start Building Free and Watch Demo.
3	Proof metrics	Show generation speed, white-label readiness, standard pages per site, and client/project capacity.
4	Live-style product demo	Simulated or interactive workflow showing fictional business input and generated website preview.
5	Built for agencies	Explain white-label, client management, hosting/export options, margins, and repeatable fulfillment.
6	Example websites	Fictional industry examples such as Alpine Halo Roofing, Brightline Dental Studio, Harbor Light Community Church, Summit Vale Legal Group, Ember & Rye Kitchen, Cedar & Stone Contractors.
7	Community/social proof	Preview curated TikTok, Instagram, Facebook, and LinkedIn posts with click-to-load embeds.
8	Business model	Explain website sale, hosting resale, domain markup, recurring revenue, and margin logic.
9	How it works	Three-step flow: enter business, generate site, launch/export/host.
10	Feature bento	AI generation, white-label branding, client dashboard, source export, SEO content, tracking pixels, hosting, domains, revisions.
11	Comparison	Position ApexSites against drag-and-drop builders, WordPress, freelancers, and general website builders.
12	SEO and AI search	Explain site structures, schema, metadata, FAQ, local pages, and AI-readable content.
13	Pricing preview	Starter, Agency, Mid-Sized Agency, Enterprise with included sites, AI credits, and seat add-ons.
14	FAQ	SEO-rich FAQ answering agency, AI website,

		credits, hosting, domains, exports, white-label, and client questions.
15	Final CTA	Strong final conversion block: Start building client websites faster.

Hero requirements

Element	Requirement
Headline	AI Websites Built in Seconds. Sold Under Your Brand.
Subheadline	ApexSites helps agencies, freelancers, and entrepreneurs generate premium, conversion-ready websites for clients without designers, developers, or weeks of production.
Primary CTA	Start Building Free
Secondary CTA	Watch Demo
Visual	Animated browser mockup, generation panel, rotating fictional industry examples, chartreuse glow accents.
Trust line	Built for agencies. White-label ready. Hosting supported. Source export available.

Homepage non-negotiables

- Do not lead with a login form. Login belongs in navigation and app.apexsites.ai.
- Do not rely on stock photos or generic AI robot imagery.
- Do not use First Church of Christ, Aurora, or any real business as a public demo example without permission.
- Do not hide pricing. Serious buyers want to know the offer structure.
- Do not load heavy social embeds by default. Use static previews and click-to-load behavior.
- Do not make the page visually busy. Premium SaaS design requires strong spacing, typography, hierarchy, and restraint.

7. Visual Design System

The visual direction should align with the existing ApexSites logo and login page: matte black/deep green-black background, white typography, neon chartreuse accent, rounded panels, subtle borders, and a clean modern SaaS interface.

Color palette

Use	Color	Notes
Primary background	#0B0F0A	Deep black/green-black base.
Secondary dark surface	#12180F	Cards, panels, mockups.
Accent	#D7FF00	Primary CTA, highlights, thin glows, key metrics. Use sparingly.
Accent variant	#B8FF00	Secondary accent and hover state.
Primary text	#FFFFFF / #111827	White on dark, near-black on light.

Muted text	#8E958F / #5B6470	Supporting copy.
Borders	#D9E1D4 / rgba variants	Soft card outlines and dividers.
Light sections	#F7FAF4	Occasional contrast sections and pricing areas.

Typography

- Use a modern sans-serif system stack for speed. Avoid external font loading in the first production version unless it is self-hosted and optimized.
- Headlines should be large, tight, and confident. Body copy should be concise and highly readable.
- Use a mono-style visual treatment only for small UI labels, stats, or product mockups. Do not overuse code-style typography.
- Maintain strong contrast and accessibility across dark and light sections.

Component style

Component	Requirement
Cards	Rounded corners, soft border, subtle gradient, restrained shadow/glow.
Buttons	Primary chartreuse with dark text. Secondary dark outlined button. Clear hover/focus states.
Bento grid	Use for product features. Each card should have a specific benefit, not generic text.
Browser mockups	Should look like real product UI, not flat placeholder blocks.
Pricing cards	Four columns on desktop, stacked on mobile. Highlight Agency as recommended.
FAQ accordions	Accessible keyboard behavior and schema-ready content.
Social proof cards	Static preview first; native embed loads only after interaction/consent.
Navigation	Sticky, transparent/dark, minimal, fast, not visually heavy.

Animation and interaction requirements

- Use subtle reveal, hover, and scroll effects only when they improve comprehension.
- Respect prefers-reduced-motion. Disable or reduce motion for users who request it.
- Avoid animation that delays content, blocks rendering, or hurts Core Web Vitals.
- Use CSS where possible and small vanilla JavaScript where required.

8. Pricing and Packaging Requirements

Pricing should be simple enough for agencies to understand immediately while still protecting ApexSites from excessive AI usage. The public page should advertise included standard sites and included AI credits. Token details should remain internal. Team seats should be sold as paid add-ons rather than included seat limits.

Plan	Price	Best for	Included usage	Key limits / features
Starter	\$49/mo	Solopreneurs,	5 standard sites/mo; 75 AI	Limited active

		freelancers, early users	credits	projects; no full white-label; source-code export; hosting add-on. Additional seats available as a paid add-on.
Agency	\$99/mo	Small agencies and serious freelancers	15 standard sites/mo; 250 AI credits	White-label branding; source-code export; client tracking pixel fields; custom agency domain; hosting add-on. Additional seats available as a paid add-on.
Mid-Sized Agency	\$299/mo	Higher-volume agencies	50 standard sites/mo; 900 AI credits	Advanced white-label; source-code export; client tracking pixel fields; team roles; priority queue; hosting included. Additional seats available as a paid add-on.
Enterprise	Custom	Resellers, franchises, platforms, high-volume teams	Custom sites and credits	Custom onboarding, SLA, SSO, reseller terms, dedicated support, custom volume, and negotiated usage.

Definition of a standard site

Standard site definition

A standard site includes up to 3 AI-generated pages, responsive structure, SEO metadata, and one quality pass. A standard site should be charged as 10 AI credits.

Feature differentiation

Feature	Starter	Agency	Mid-Sized Agency	Enterprise
Standard sites/month	5	15	50	Custom
AI credits/month	75	250	900	Custom
Additional team seats	Paid add-on	Paid add-on	Paid add-on	Custom
Active client projects	Limited	25	100	Custom
White-label branding	No	Yes	Advanced	Advanced/custom

Source-code export	Yes	Yes	Yes	Custom
Hosting	Add-on	Add-on	Yes	Custom
Custom domains	Client domains only	Agency domain + client domains	Agency domain + client domains	Custom
Support	Standard	Priority	Priority	Dedicated

Credit pack add-ons

Credit pack	Price	Approximate site equivalent	Policy
100 credits	\$39	About 10 standard sites	Add-on credits may expire after 12 months.
300 credits	\$99	About 30 standard sites	Best for short-term spikes.
1,000 credits	\$299	About 100 standard sites	For agencies not yet ready for Enterprise.

Monthly plan credits should expire monthly. Purchased credit packs can carry a longer expiration period, such as 12 months, to create flexibility without undermining subscription plan economics.

9. AI Credit and Token Usage Model

The biggest cost driver will be token usage. The customer experience should not expose tokens. Internally, ApexSites should manage usage through a credit abstraction tied to model routing, generation actions, and expected token cost.

Public vs internal language

Public customer language	Internal operating language
Includes 15 standard websites per month.	Plan includes 250 credits; each standard site costs 10 credits.
Additional pages and revisions use AI credits.	Credits map to weighted token budgets and model-cost controls.
Premium design pass available.	Route through Sonnet for design/copy judgment and charge additional credits.
SEO metadata included in standard site.	Use Haiku or low-cost model path for metadata and QA where appropriate.

Recommended internal conversion model

Internal credit definition

1 ApexSites AI credit should equal approximately 25,000 Sonnet-weighted token units. Weighted token units = input tokens + (output tokens x 5).

The weighting is important because output tokens cost materially more than input tokens. A simple raw-token conversion would create poor margin control.

Estimated 3-page website token profile

Step	Model path	Estimated input tokens	Estimated output tokens
Business intake and understanding	Haiku or Sonnet	8,000-15,000	2,000-4,000
Site strategy and page plan	Sonnet	10,000-18,000	3,000-6,000
Homepage/about/services copy	Sonnet or Haiku depending on quality path	15,000-30,000	8,000-15,000
Design specification and component plan	Sonnet	12,000-25,000	5,000-10,000
SEO metadata and QA pass	Haiku	10,000-25,000	2,000-5,000
Typical total	Optimized pipeline	55,000-110,000	20,000-40,000

Using the weighted model, a typical 3-page site should consume roughly 155,000-310,000 weighted token units, or about 6-12 credits. Charging 10 credits for a standard site is the right default.

Action-based credit charges

Action	Customer credit charge
Generate standard 3-page website	10 credits
Regenerate full website design	6 credits
Add one extra page	3 credits
Simple AI revision	1 credit
Advanced copy/design revision	2-3 credits
Import/research existing website	2-4 credits
Local SEO FAQ/schema pack	2 credits
Premium Sonnet design pass	+5 credits

Model routing principle

- Use Haiku-class models for extraction, summarization, metadata, classification, validation, and lightweight QA.
- Use Sonnet-class models for design judgment, conversion copy, page strategy, layout planning, and complex revisions.
- Do not regenerate full sites unnecessarily. Use componentized site rendering and targeted revision operations.
- Cache reusable system prompts, design rules, component documentation, and brand constraints wherever possible.
- Track cost per generation, credits consumed, model path, output length, retries, and user plan.

10. SEO Strategy Requirements

The SEO strategy must build topical authority, not just optimize one homepage keyword. ApexSites should target a broad keyword universe related to AI website builders, agency website software, white-label website builders, website reseller platforms, local business websites, web design business growth, and AI website generation.

Keyword universe

The SEO plan should support approximately 10,000 relevant keyword and keyphrase targets. These targets should be organized into clusters and validated through paid SEO tools before scaled publishing. The homepage should serve as the top-level authority page, while solution, industry, comparison, and resource pages capture long-tail demand.

Primary keyword clusters

Cluster	Example targets
AI website builder	AI website builder, AI website generator, AI website creator, build websites with AI.
Agency website software	website builder for agencies, AI agency software, agency website platform.
White-label website builder	white-label website builder, white-label AI website builder, website reseller platform.
Local business website generation	AI websites for roofers, dentists, churches, law firms, restaurants, contractors, real estate agents.
Competitor comparisons	ApexSites vs Wix Studio, vs Webflow, vs Framer, vs Duda, vs 10Web, vs WordPress.
Agency growth	how to start a web design business, sell websites to local businesses, recurring website hosting revenue.
AI search and SEO	AI-ready websites, schema for AI search, local SEO website builder, AI SEO website builder.

On-page SEO requirements

- Every page must have a unique title tag, meta description, canonical URL, H1, logical heading hierarchy, and clear internal links.
- Homepage must include product definition, target users, use cases, examples, pricing preview, FAQ, and schema.
- Pricing page must include plan schema-friendly content and clear usage definitions.
- Examples pages must use fictional businesses until real customer permission exists.
- FAQ content should answer real buyer questions in full paragraphs, not one-line responses.
- Internal linking must connect homepage, features, pricing, examples, solutions, industries, comparisons, resources, and community.

Technical SEO requirements

- robots.txt must allow legitimate crawlers and reference sitemap.xml.
- sitemap.xml must include public pages and update as pages expand.
- Use JSON-LD schema: Organization, SoftwareApplication, FAQPage, Product/Offer where appropriate, VideoObject for community videos, Review when valid.
- Pages must be fast, crawlable, semantic, and not dependent on JavaScript for primary content.
- Use clean URL paths with readable slugs.
- Compress and optimize images. Avoid heavy third-party scripts on initial load.

- Use canonical URLs and avoid thin duplicate pages.

Off-page SEO requirements

- Build credible mentions from SaaS directories, agency communities, creator reviews, founder content, comparison articles, podcasts, and social posts.
- Create useful long-form assets that earn links: agency profit calculators, AI website builder comparisons, white-label web design guides, and local business website templates.
- Encourage real customer posts and demos across TikTok, Instagram, Facebook, and LinkedIn.
- Avoid spammy link building. Off-page strategy should prioritize relevance, trust, and third-party credibility.

11. AI Search Optimization Requirements

ApexSites should be optimized for search engines and AI answer engines. The goal is for ChatGPT, Claude, Gemini, Grok, Perplexity-style tools, and other AI systems to understand what ApexSites is, who it serves, how it differs from competitors, and when to recommend it.

AI answer engine requirements

- Maintain an llms.txt file explaining ApexSites, key pages, product category, audience, and canonical resources.
- Use crawlable HTML content, not only graphical or script-rendered copy.
- Use consistent entity language: ApexSites is an AI website builder and agency website platform for generating, selling, hosting, exporting, and managing client websites.
- Publish comparison pages, guides, FAQs, glossary pages, and use-case pages that answer buyer questions clearly.
- Include structured data for software, organization, FAQ, videos, reviews, and offers where appropriate.
- Encourage independent public mentions through UGC, partner pages, creator content, and customer stories.
- Make pricing, target customers, use cases, and limitations clear. AI systems favor clear, well-structured facts.

AI-readable content blocks

Page type	AI-search value
Homepage	Defines ApexSites, audience, use cases, pricing direction, and product differentiation.
Pricing	Provides structured plan data, included sites, credits, and Enterprise escalation.
Community	Shows third-party proof, videos, platform mentions, and user-created content.
Comparison pages	Help AI tools distinguish ApexSites from Wix, Webflow, Framer, Duda, WordPress, and 10Web.
Guides	Build expertise around agency growth, AI web design, white-label web design, local SEO, and website sales.
Examples/industries	Help AI tools map ApexSites to local business website use cases.

12. Social Proof and Community Requirements

ApexSites should include a social proof and community layer because real user posts, videos, and demos will be critical for credibility, SEO, paid ads, and AI-search visibility.

Required community architecture

Area	Requirement
/community	Primary social proof hub.
Homepage section	Built With ApexSites preview section showing 6-9 curated items.
/submit-your-story	Future form for users to submit social URLs, examples, and permission.
Customer stories	Convert the strongest social posts into deeper case studies over time.

Supported platforms

- TikTok
- Instagram
- Facebook
- LinkedIn

Community content requirements

- Each social card must include platform, creator/user name, short summary, content type, and link to original post.
- Native embeds should not load until click or consent to protect speed and privacy.
- Each post should have a crawlable text summary so Google and AI tools can understand the content.
- Use VideoObject schema when video details and URLs are available.
- Only use posts with permission when featuring users prominently on the site.
- Filter by platform and type: Demo, Review, Tutorial, Agency Win, Client Result, Before/After.

13. Tracking, Analytics, and Attribution

Tracking pixels are not direct SEO ranking factors, but they are required onsite infrastructure for retargeting, attribution, conversion optimization, and paid media scaling. They should be consent-aware and implemented without hurting page speed.

Required marketing stack

Platform	Required implementation	Purpose
Google	Google Tag Manager, GA4, Google Ads tag, Enhanced Conversions	Analytics, paid search attribution, retargeting, conversion optimization.
Meta	Meta Pixel and Conversions API	Facebook/Instagram retargeting and conversion optimization.
TikTok	TikTok Pixel and Events API	TikTok ads, creator campaign attribution, retargeting.
LinkedIn	LinkedIn Insight Tag and Conversions API	B2B retargeting, agency-owner targeting, lead attribution.

Recommended event taxonomy

Event	Trigger
-------	---------

PageView	Any page load.
ViewContent	Feature pages, pricing page, demo section, examples, and community.
CTA_Click	Start Free, Watch Demo, View Pricing, Generate Site, Contact Sales.
Lead	Email captured, demo form submitted, contact form submitted.
CompleteRegistration	User creates an account.
StartTrial	User begins trial.
GenerateSiteStarted	User starts first website generation.
GenerateSiteCompleted	First website generated.
PricingViewed	Pricing section or page viewed.
InitiateCheckout	User begins upgrade/payment.
Subscribe	Paid plan activated.
DemoBooked	Demo call scheduled.

Data layer requirements

All key events should be pushed into a clean data layer. Example fields should include event name, user type, plan type, industry, pages generated, source, conversion value, and consent state.

Consent requirements

- Use a cookie consent banner and consent preferences.
- Do not load marketing pixels before consent where legally required.
- Support Google Consent Mode through GTM where applicable.
- Provide Privacy Policy, Cookie Policy, Terms of Service, and opt-out controls.
- Use asynchronous loading and prevent duplicate tags.

14. Technical, Performance, and Accessibility Requirements

The site must be production-grade and fast. The current production frontpage direction is static, lightweight, and built with semantic HTML, optimized CSS, vanilla JavaScript, structured data, robots.txt, sitemap.xml, llms.txt, manifest, and a 404 page.

Performance requirements

- No external JavaScript libraries unless strictly necessary.
- No external fonts in the initial production version unless self-hosted and preloaded responsibly.
- Defer non-critical JavaScript.
- Keep primary content server-rendered or static and crawlable.
- Use optimized local image assets and CSS-only mockups where practical.
- Gate marketing tags behind consent and load asynchronously.
- Avoid loading native social embeds until interaction.
- Pass Core Web Vitals on mobile and desktop before launch.

Accessibility requirements

- Use semantic landmarks: header, nav, main, section, footer.

- Maintain one clear H1 per page and logical heading order.
- Provide accessible button and link labels.
- Ensure color contrast across dark and light sections.
- Support keyboard navigation for menus, accordions, and CTA elements.
- Respect prefers-reduced-motion.
- Provide alt text for meaningful images and empty alt for decorative images.
- Forms must use labels, validation messages, and accessible focus states.

Production files and deployment

File / asset	Requirement
index.html	Full production homepage.
assets/css/styles.css	Responsive design system and page styles.
assets/js/main.js	Navigation, FAQ, reveal, and consent handling.
assets/js/tracking.js	Consent-aware tracking scaffold for Google, Meta, TikTok, and LinkedIn.
robots.txt	Search crawler instructions.
sitemap.xml	Public URL index.
llms.txt	AI-search optimization reference.
manifest.webmanifest	PWA/browser metadata.
404.html	Custom not-found page.

The frontpage can be hosted on Vercel, Cloudflare Pages, Netlify, S3/CloudFront, or another static host. Vercel or Cloudflare Pages are preferred for speed and operational simplicity.

15. Content Standards and Copy Direction

Copy principles

- Write for agency owners and entrepreneurs who care about speed, margin, credibility, and client delivery.
- Use plain, direct, high-conversion language. Avoid vague claims and empty AI hype.
- Each page should answer what the product is, who it is for, what it does, why it is better, how it works, how much it costs, and what to do next.
- Use fictional business examples unless a real user explicitly grants permission.
- Pricing copy should lead with included sites and credits, not tokens.
- Every major section should have a clear buyer reason to continue scrolling.

Required FAQ topics

- What is ApexSites?
- What is an AI website builder?
- Can agencies use ApexSites under their own brand?
- Can I sell websites generated by ApexSites?
- How do standard sites and AI credits work?
- Does ApexSites include hosting?
- Can clients use their own domain?
- Can I export source code?

- Does ApexSites generate SEO content?
- Can ApexSites build websites for local businesses?
- How is ApexSites different from Wix, Webflow, WordPress, Framer, Duda, or 10Web?
- Can I add Meta, TikTok, Google, or LinkedIn pixels to client sites?
- What happens if I need more sites or credits?
- Who should choose Enterprise?

16. Acceptance Criteria

Category	Acceptance criteria
Brand/design	Looks premium, modern, and agency-focused. Matches logo color system. Avoids generic AI visuals.
Homepage clarity	Visitor understands ApexSites within five seconds. Hero and CTA are clear.
Conversion	Start Free, Watch Demo, View Pricing, and Contact Sales CTAs are visible and tracked.
Pricing	Shows Starter \$49, Agency \$99, Mid-Sized Agency \$299, Enterprise custom. Displays included standard sites, AI credits, hosting status, and seat add-ons.
Examples	Uses fictional businesses only unless real permission exists.
SEO	Each page has title, meta description, canonical, H1, structured content, internal links, and schema where appropriate.
AI search	Includes llms.txt, structured definitions, FAQ content, and crawlable entity information.
Tracking	Consent-aware tracking scaffold exists for Google, Meta, TikTok, and LinkedIn. Event taxonomy is implemented.
Performance	No unnecessary external libraries, deferred JS, optimized assets, and strong Core Web Vitals.
Accessibility	Semantic HTML, keyboard navigation, sufficient contrast, reduced motion support, and labeled controls.
Quality assurance	Internal links, assets, schema, pricing, and prohibited references are checked before launch.

Pre-launch QA checklist

- Confirm no First Church, Christ Scientist, Aurora, or other real demo references remain unless approved.
- Confirm pricing and credit limits match this PDR.
- Add production IDs to tracking.js or GTM container before launch.
- Validate JSON-LD schema.
- Run Lighthouse/PageSpeed tests on mobile and desktop.
- Validate sitemap.xml, robots.txt, and llms.txt.
- Test all CTA links and forms.
- Test mobile navigation and FAQ accordions.
- Confirm no heavy third-party social embeds load by default.
- Confirm privacy/cookie consent behavior before marketing tags load.

17. Launch Plan and Roadmap

Phase 1: Production frontpage launch

- Deploy the static production frontpage.
- Confirm all SEO metadata, schema, sitemap, robots.txt, llms.txt, and tracking scaffolds are present.
- Use fictional examples and proof-of-product sections.
- Publish pricing with the four-plan model.
- Connect Start Free and Login to the app or placeholder onboarding flow.

Phase 2: Core marketing site expansion

- Build Features, Pricing, Examples, Community, Resources, Solutions/Agencies, Industries, and Comparison pages as full production pages.
- Create initial industry pages for roofing, dental, church, law firm, restaurant, contractors, and real estate niches.
- Create comparison pages against Wix Studio, Webflow, Framer, Duda, 10Web, WordPress, and Squarespace where relevant.
- Build resource hub with agency growth and AI website design guides.

Phase 3: SEO and AI-search content engine

- Validate keyword universe in Ahrefs, Semrush, or Google Keyword Planner.
- Publish long-form guides, FAQ pages, glossary pages, and industry pages.
- Build structured internal linking from homepage to solution, industry, comparison, and resource pages.
- Collect social proof and user-generated posts for the community page.
- Monitor organic traffic, rankings, AI referrals, and brand mentions.

Phase 4: Product-led conversion improvements

- Make the homepage demo interactive or connected to a limited generation experience.
- Add ROI/profit calculator for agencies.
- Add site preview gallery with real customer examples after permission.
- Add plan comparison, credit estimator, and overage calculator.
- Add onboarding flows by persona: Freelancer, Agency, Mid-Sized Agency, Enterprise.

18. Appendices

Appendix A: Public sitemap target

/, /features, /how-it-works, /pricing, /examples, /community, /resources, /solutions/agencies, /solutions/solopreneurs, /solutions/freelancers, /solutions/white-label-website-builder, /industries/[industry], /compare/[competitor], /case-studies, /about, /contact, /login, /signup.

Appendix B: Fictional business examples

Business	Industry
Alpine Halo Roofing	Roofing
Brightline Dental Studio	Dental
Harbor Light Community Church	Church
Summit Vale Legal Group	Law firm

Ember & Rye Kitchen	Restaurant
Cedar & Stone Contractors	Construction

Appendix C: High-level homepage wireframe

Navigation -> Hero -> Proof metrics -> Live-style demo -> Built for agencies -> Example websites -> Community/social proof -> Business model -> How it works -> Feature bento -> Comparison -> SEO and AI search -> Pricing -> FAQ -> Final CTA.

Appendix D: Hosting and monetization note

ApexSites should charge separately for client hosting, domain resale/markup, additional seats, additional credits, and advanced support. The SaaS subscription should not include unlimited production hosting or unlimited AI generation. Hosting should be positioned as an agency revenue opportunity, not merely a technical feature. Mid-Sized Agency includes hosting; Starter and Agency use hosting as an add-on.

Appendix E: Current production frontpage build notes

The current production frontpage build includes a static index.html, responsive CSS, vanilla JavaScript, a consent-aware tracking scaffold, robots.txt, sitemap.xml, llms.txt, manifest, and a custom 404 page. The debug report shows no errors or warnings and notes HTML size of approximately 34 KB, CSS size of approximately 25 KB, main JS size of approximately 3 KB, and three structured data blocks.

Final design mandate

The ApexSites website must feel like a premium SaaS sales asset: visually disciplined, fast, SEO-ready, conversion-focused, and credible enough that agencies believe the product can support real client revenue.
